Acknowledgements

Thanks go to **Rowan Wright** for making his property available for the conduct of this trial, which provides district graziers with valuable comparative information. Rowans' (and his farm manager Mark Mills) meticulous management has been outstanding throughout the trial.

Thanks to all the **participants** who entered a team, without your support there is no trial and thank you to **Brownlie Bros Shearing Pty Ltd** (special mention Stephen and Lionel Platts for the classing.)

Thanks also to our **main sponsor, Gordon Litchfield Wool** [Gordon Litchfield and Sam Green], whose assistance at mid-side sampling and shearing each year was greatly appreciated. Thanks also to the following sponsorship; **Jemalong Wool** (2012), **Riverina Wool Testing (RWT)** for a discount on fleece test costs, **AWI** for covering length and strength test costs for 2014, and **Gallagher** who provided their auto-drafter for the 2013 shearing.

Thankyou to all the MFS committee members, in particular, **Alan McGufficke** who gave numerous hours of his time to manage this trial for the three years. Thank you also to **Doug Alcock** (NSW DPI and Graz Prophet), **Phil Graham** (NSW DPI), **Matt Lieschke** (SE LLS) and **Luke Pope** (SE LLS) who have put in considerable time and expertise to ensure the trial is conducted to the highest standard.

Valuation Basis

Average market prices for the 12 month calendar year were used to value all fleeces, pieces etc. Fleeces were valued within their bin lines (AAAM, BBB etc) on the basis of the average micron and discounts applied according to the tested length, strength and observed colour. This method avoids the issue of single fleeces of being valued at elevated levels even though they could not be sold this way in reality. The net result is a valuation for the team which is very like the result that would occur in the commercial shearing shed.

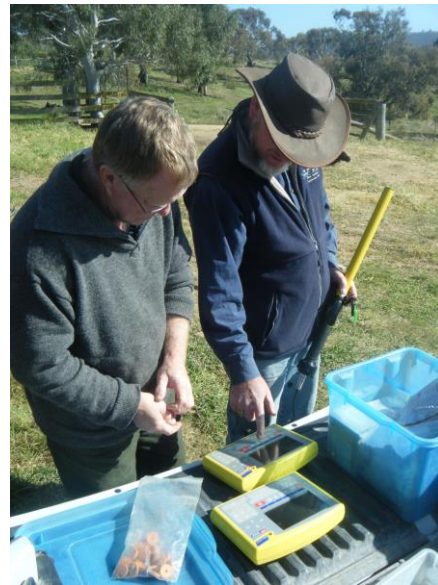

Visual Scores

Fleece rot is scored according to the method shown in Primefact 551 Scoring Sheep for Fleece Rot . The greatest incidence of fleece rot was in the tip of the fleece indicating that the wet summer conditions had taken their toll (2012). There was however considerable variation with the average score of all sheep being 1 and the highest score recorded 5. When flies are present and sheep are not chemically protected, animals with score 4 and 5 fleece rot are likely to be struck. Some sheep are resistant to fleece rot and the prevalence of this resistance can be improved by direct selection methods based on fleece rot score.

Body Wrinkle Score was also assessed using the standards described in Visual Sheep Scores, 2007, (MLA & AWI). Scores range from 1 to 5 with a one score sheep having a plain body with no wrinkle. Score 3 indicates slight wrinkling over the length of the body while score 2 indicates a plain body with a few small wrinkles over the shoulders and hips.

Live-weight and DSE Rating

All wethers were weighed and fat scored at the time of even up shearing as well as at mid side sampling. Fleece free body weights were calculated by subtracting the total wool weight of each sheep from this body weight at mid side sampling. DSE rating was calculated by adding the energy required to maintain the average weight of the animal throughout the year and the energy required for the average rate of gain in weight throughout the year using published relationships (SCA 1990). This DSE rating was used to determine the expected gross margin per DSE. Gross Margin was calculated by subtracting a constant \$14.82 variable costs per head from the average gross wool value of the team. Overall there was more than \$24 per DSE difference in profit between the top and bottom ranked teams with the top team \$83.51 and the bottom team \$59.20.

Why be involved in wether trials?

Wether trials provide benefits at a number of levels:

- Gives individuals a robust benchmark of how their sheep perform compared to the local industry.
- By combining the results from a number of trials, information about industry bloodlines is available to producers. The latest combined bloodline analysis will be released by the end of 2014. This uses the last 10 years of trial data.
- The information can be used to show basic relationships between traits which can help producers in decision about their breeding direction.

This report will focus on the relationship between the traits and their relationship with the dollar returns. If you want to examine the difference between bloodlines then the best information is in the combined bloodline analysis due to its larger data set. The second part of the report has yearly summary tables from this trial plus wrinkle and fat score data.

Trial results

The results from the whole trial have been split into 2 groups depending on the property of origin. The main group is for teams that have come off a commercial property and the second group for properties that sell rams. The stud or ram breeding property has a genetic advantage due to a shorter generation interval so their productive should be higher than their clients. So it is best to examine the data within the groups rather than a combined list.

The factors that need to be considered when examining the results of a wether trial are \$ returns /hd corrected for body weight, to take account of the amount of feed that stock eat and the death rates that occur over the life of the trial. In any trial deaths could be by accident but can also give some indication of the robustness of the stock.

The data below uses the total income from the trial (3 shearing + 1 carcass) corrected to a dse, in the no death column the total is divided by the number of wethers contributing to the data. If there were no deaths this figure is 45 (15 per team * 3 shearings). The team with the most losses had 41 wethers contribute.

In the deaths column the total figure is divided by 45 for all teams. For teams which lost no stock the result will be the same in both columns.

Two teams started the trial with 14 animals (Team 4 and 22) their data has been corrected by adding the average of the team to each year to give a total based on 45 sheep, then any death are accounted for in the next column.

In this trial there were 2 teams from the one property and the one drop, (Team 1 and 28). There is a difference of about \$3/dse between these teams, so this gives us an idea of the “noise” that is in the whole data set. You are looking for differences greater than \$3 /dse to be meaningful differences.

Overall Ranking – 2012 - 2014

Teams from commercial properties.

No deaths		Deaths factored in	
Ave/dse	Team no	Ave /dse	Team no
78.11	21	77.95	7
77.95	7	76.47	15
76.47	15	75.03	26

59.20	10	57.89	10

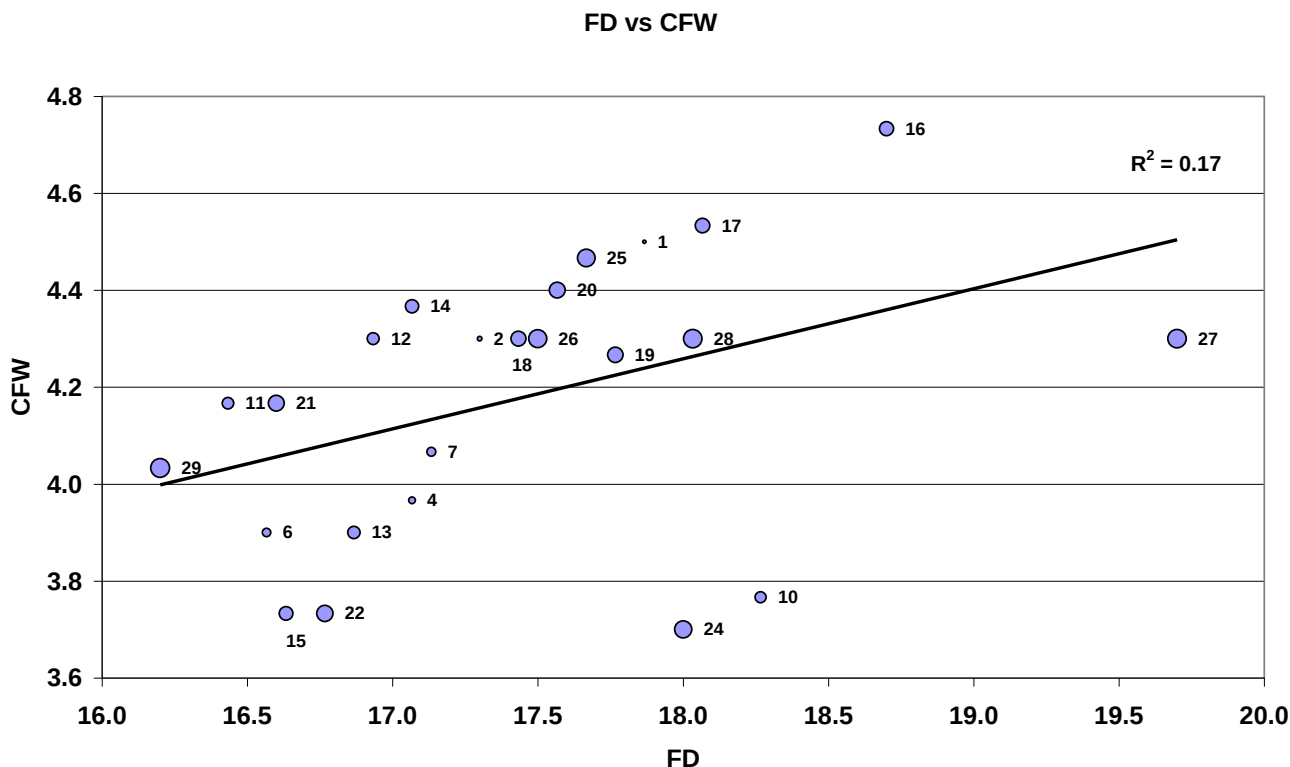

Trait relationships

The following graphs have used the average fibre diameter, clean fleece weight and body weight from the 3 shearings to get a team value. The dollar value is the total of the 3 fleeces plus carcass for the team divided by the number of animals that contributed to the total (max 45, so this value is placing no dollar impact on the deaths during the trial). This gives an average return /hd, this is then divided by a DSE rating based on the body weight to give a average /DSE.

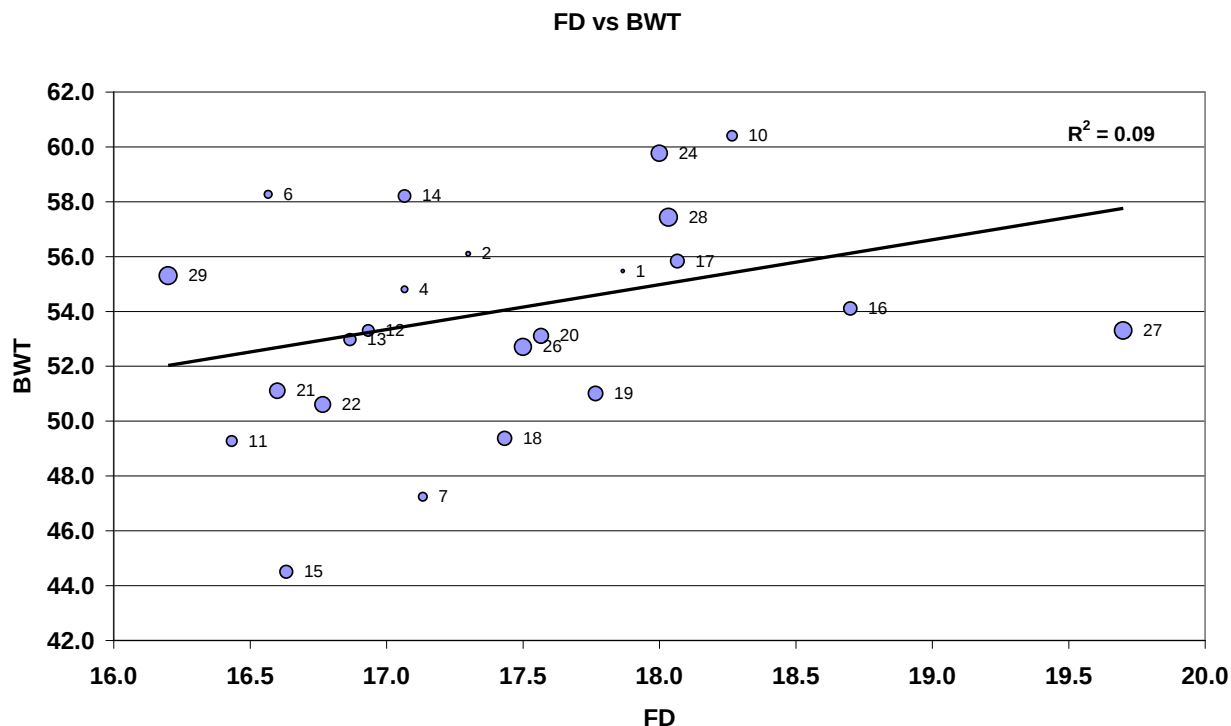

The first 3 graphs look at the relationship between the 3 major production traits, fibre diameter, clean fleece weight and body weight. The **numbers on the graphs are the team numbers**.

On each graph is an R² value (top right corner) which gives an idea how strongly the relationship is. If the R² was 1 then all points would be on the line, at an R² of 0 there is no relationship. If the R² is below 0.1 then there is effectively no linkage and between 0.1 and 0.2 it is very weak.

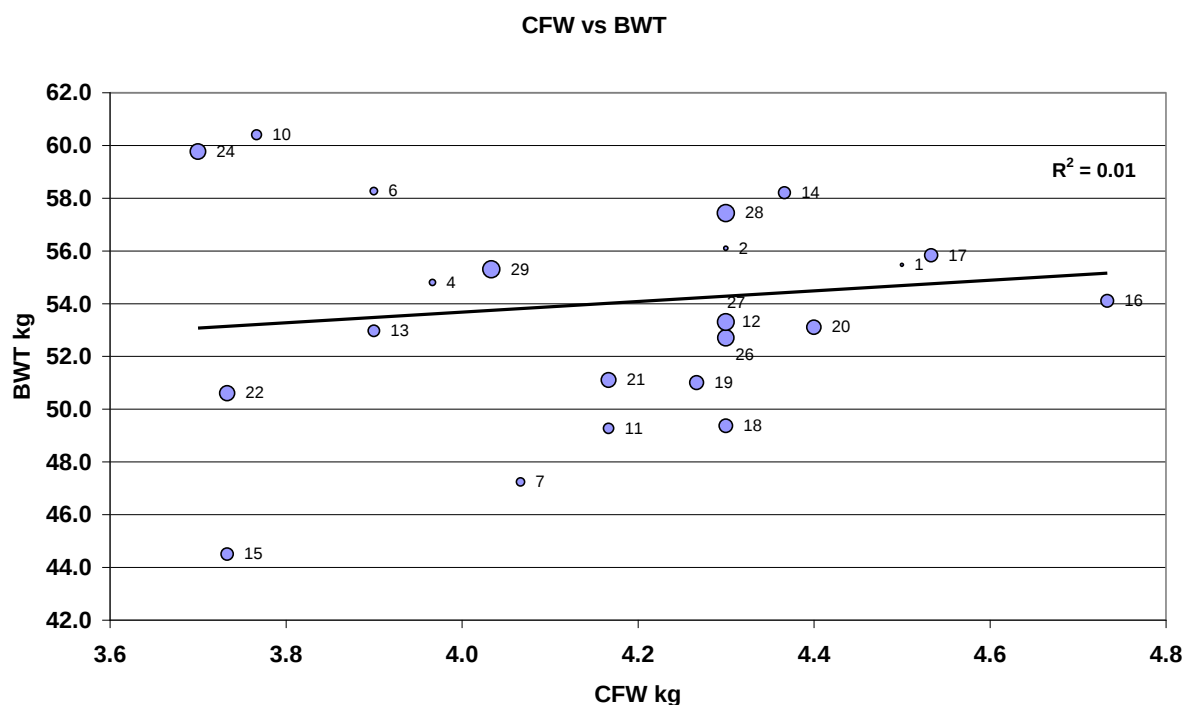

Graph 1 – Relationship between Fibre Diameter (FD) and Clean Fleece Weight (CFW)

Graph 2 – Relationship between Fibre Diameter (FD) and Body Weight (BW)

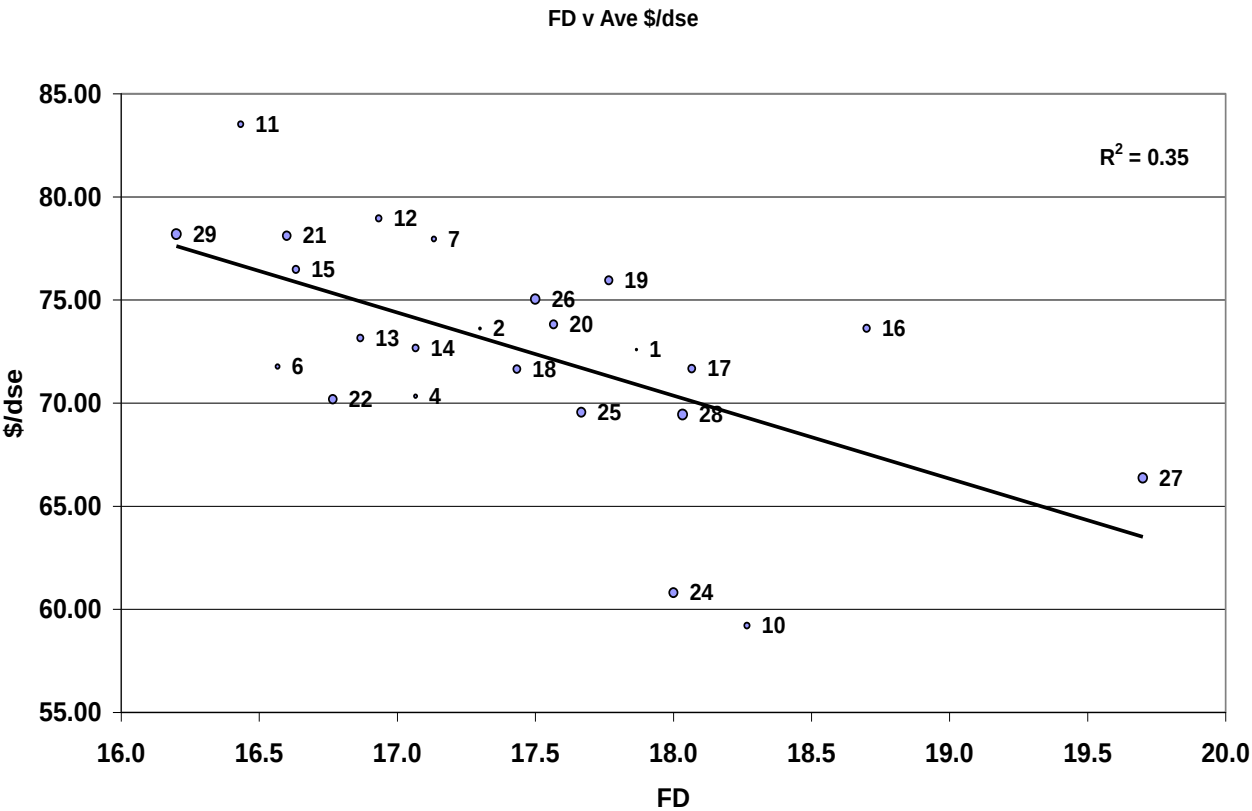

Graph 3 – Relationship between Clean Fleece Weight (CFW) and Body Weight (BW)

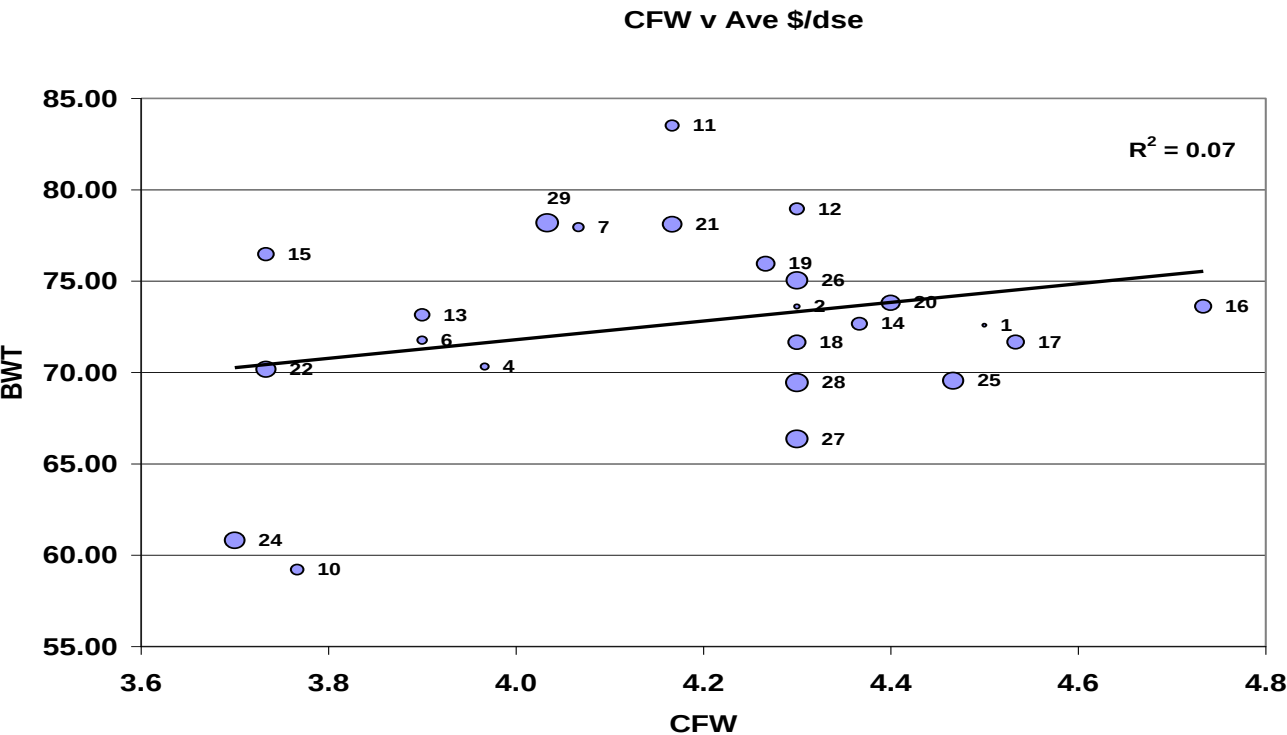

At an R^2 of 0.01 for body weight and clean fleece weight and 0.09 for body weight and clean fleece weight there is no relationship between these traits in this data set. The relationship is weak for fibre diameter and clean fleece weight. In summary **there is no strong relationship between the traits** meaning you can breed for any combination that you want provided you apply the correct pressure.

The next series of graphs look at the **impact of each of the traits on the average \$/DSE** from the trial.

Graph 4 – Relationship between Fibre Diameter (FD) and average \$/DSE

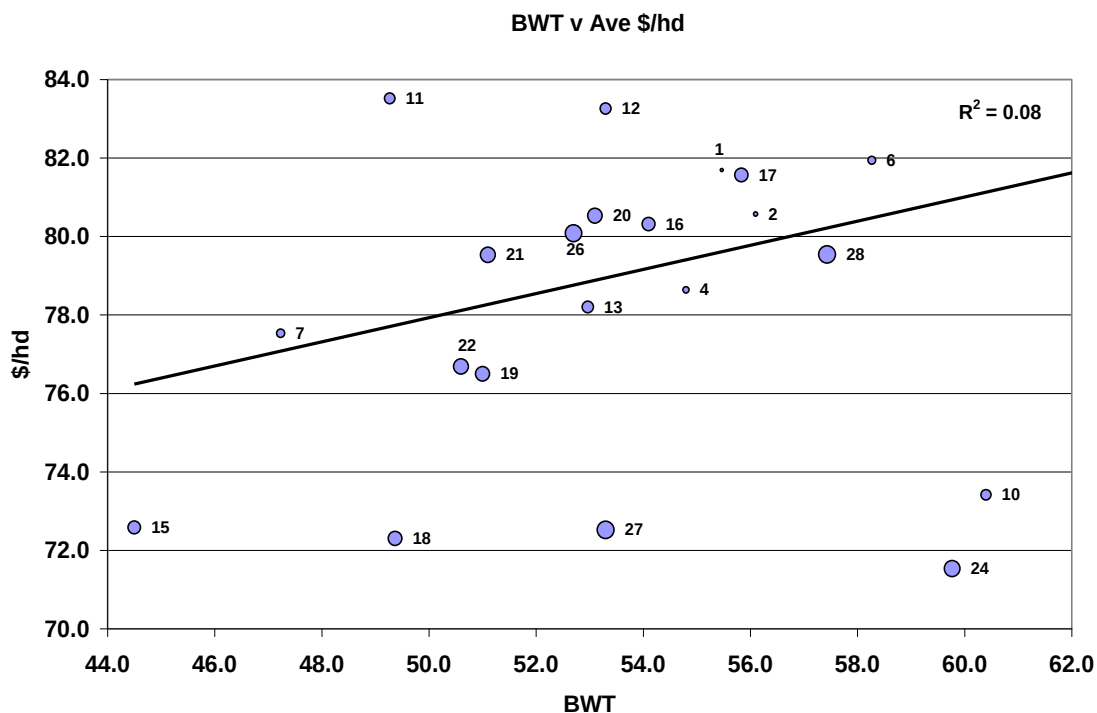

Graph 5 – Relationship between Clean Fleece Weight (CFW) and average \$/DSE

The dollar and body weight graph has used the average \$/hd instead of average \$/dse as this already has had correction for relative weights.

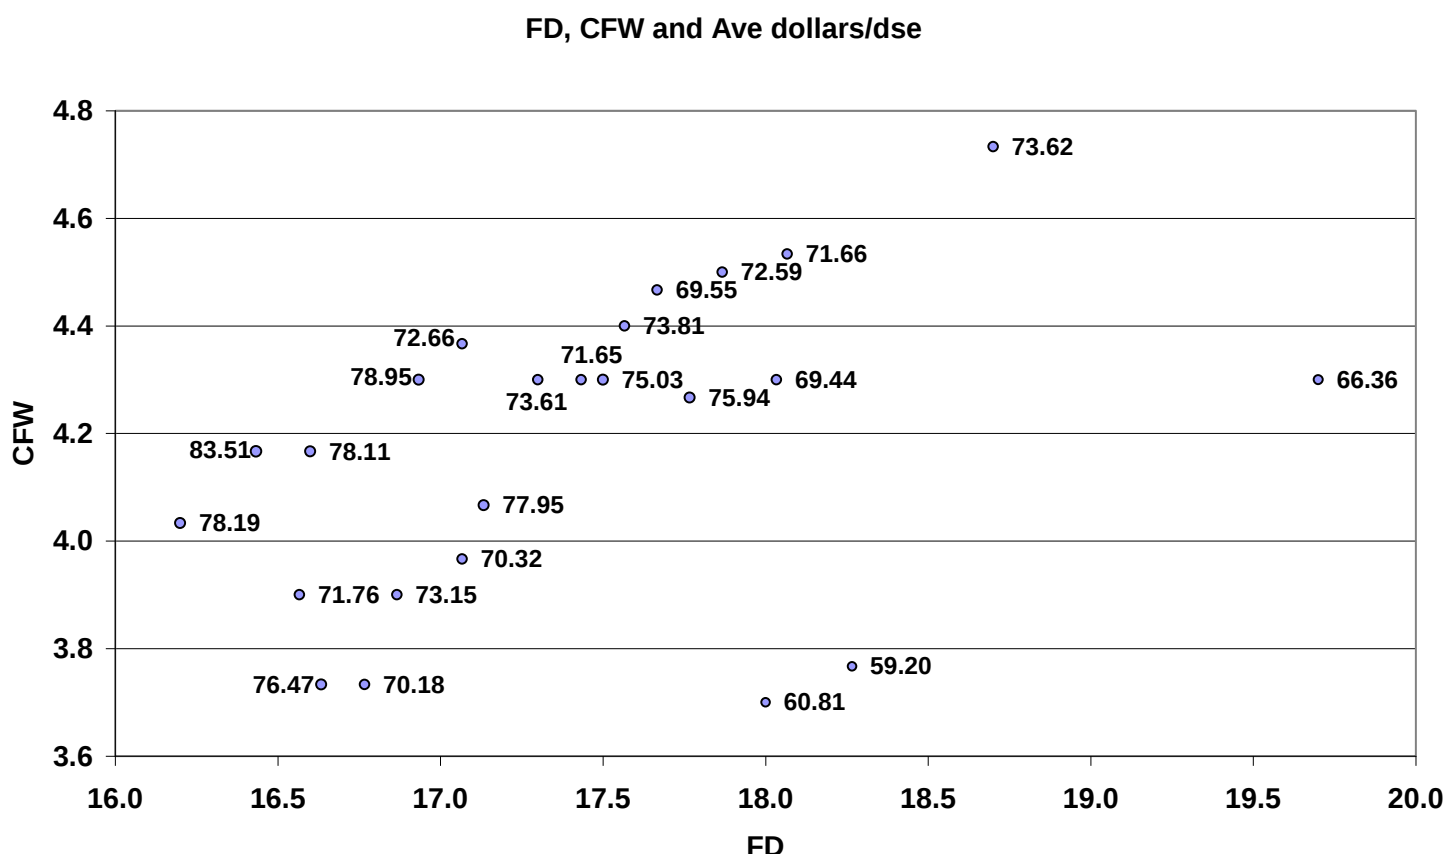

Graph 6 – Relationship between Body Weight (BWT) and average \$/hd

From this data **fibre diameter is the only trait to have any relationship with the income earned**. I would expect if 2014 data only was graphed then the \$ vs CFW would have been the dominate trait rather than fibre diameter.

Graph 6 shows 3 traits and gives a clearer picture. Fibre diameter and clean fleece weight are plotted and at each point the average dollars/dse is displayed. The highest teams are grouped around average for fleece weight but below average for FD. They have the right combination of the 2 important traits. The lowest values are below average for fleece weight and above for FD. The carcass income has some minor impact on teams such that they perform differently from teams nearby.

To give a more comprehensive picture I have included the R2 values for the traits listed from two additional data sets. The Bookham set is from the trial run from 2011 to 2014 and the combined data is from the combined bloodline analysis of 73 bloodlines completed in late 2014 using data from 2004 to 2013. The comparison involving \$/dse will have “noise” as the time periods and the number of fleeces to carcass varies.

The relationship between CFW and FD is the strongest in all data and FD and BWT is the weakest.

Even in the combined data with the higher R2, there are still bloodlines that have achieved a more profitable CFW/FD balance due to their breeding program. The combined data has higher values because it is the average of a number of teams for each bloodline. This removes the noise that comes from one trial where 1 or 2 teams can have an impact on the R2 values

In summary there is a strong ability to breed sheep in any direction you want but care needs to be taking in setting that direction because not all result in the same farm profit.

Table 1 - R2 Values for the traits listed for three data sets (the higher the R2 value the stronger the relationship)

	MFS	Bookham	Combined
CFW v FD	0.17	0.31	0.52
CFW v BWT	0.01	0.18	0.47
FD v BWT	0.09	0.07	0.25
FD v \$/dse	0.35	0.14	0.12
CFW v \$/dse	0.07	0.15	0.05

The **fleece rot** and **fat scores** were collected pre shearing 2013.

The fleece rot score goes from 1 to 5, with 1 showing no signs of fleece rot with a 5 score having colour and crusty material larger than 10 cms. Each sheep is given a score and the data below is the average for the team. To get a score greater than 1 means that some sheep had scores of 2 to 4. There were no scores 5 in the trial. The risk of body strike increases with an increased fleece rot score.

The same method applies to the fat scores. Each wether is assessed and the fat score below is the average for the team. The timing of this assessment was at the end of winter.

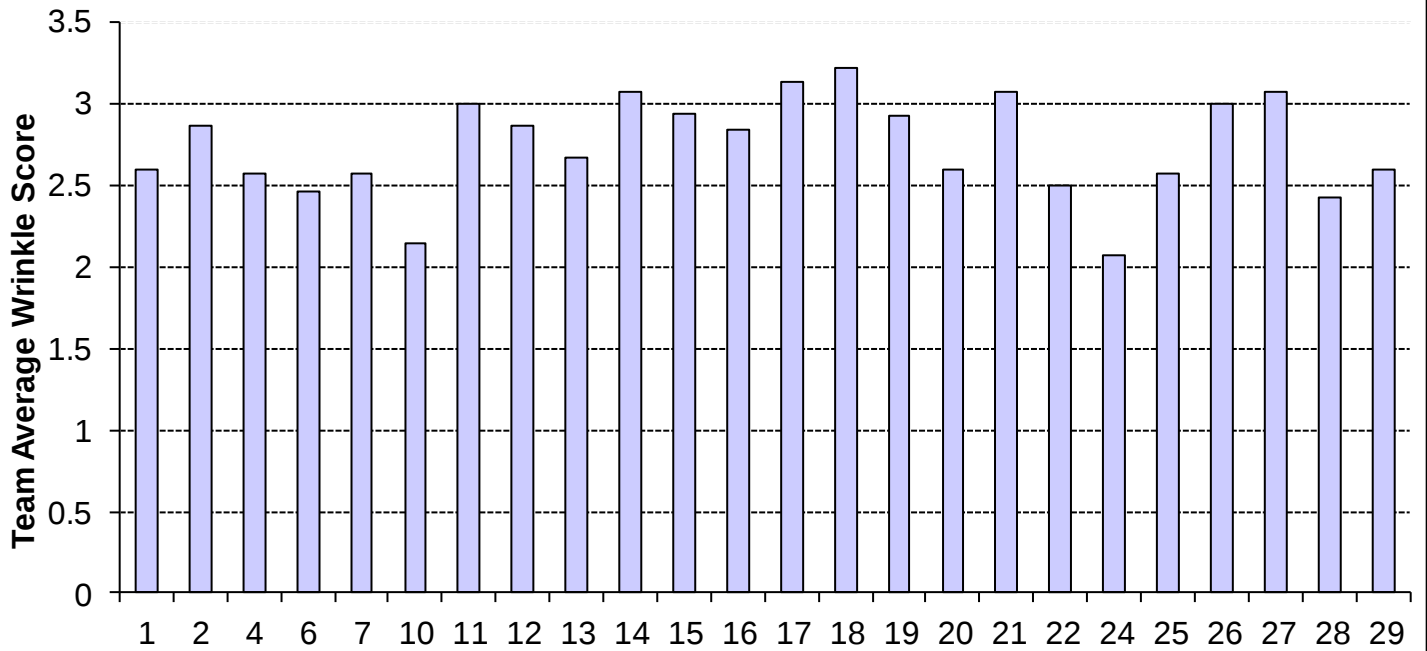

The **body wrinkle scores** were done after the first shearing (2012), again each wether is assessed and the average is in the graph below. A wrinkle score of 1 is what you would see on a plain xbred ewe. The majority of merino sheep are in the range of 2 to 3.5. The 4 and 5 scores are the sheep the industry can do without. There were some 4 scores in the trial. The variation within the teams ranged between 0.6 to 1 score, with the higher range for the higher average scores.

On the **AWI web site**, search for fleece rot or wrinkle score and you will get the booklet which shows the differences for all the scores.

Team No	Fat score	Fleece rot score	Team No	Fat score	Fleece rot score	Team No	Fat score	Fleece rot score	Team No	Fat score	Fleece rot score
1	2.5	1.2	11	2.3	1	17	2.7	1	24	2.4	1.2
2	2.3	1.1	12	2.5	1	18	2.2	1	25	2.5	1.1
4	2.3	1	13	2.6	1	19	2.2	1	26	2.6	1.1
6	2.5	1.1	14	2.9	1	20	2.5	1.3	27	2.6	1
7	2.6	1	15	2.3	1	21	2.4	1.1	28	2.3	1.4
10	2.3	1	16	2.4	1.2	22	2.2	1	29	2.6	1.1

Team Average Body Wrinkle Score (16/10/2012)

Thankyou again to all involved in this trial and for **any further information** please contact Nancy Spoljaric (MFS Project Officer), nancy@msanda.com.au or 0438 066 322.
